Impacto de las plagas en la agricultura

En Ecuador el **60%** de agricultores reportan que una causa importante de las pérdidas de sus cultivos en precosecha son las plagas y enfermedades

¿Por qué el maíz?

Data for: Identification of Plant Leaf Diseases Using a 9-layer Deep Convolutional Neural Network

Corn Disease Detector

CDD - Corn Disease Detector es un **modelo** de clasificación de aprendizaje profundo basado en redes neuronales convolucionales, que fue entrenado para detectar de manera automática dos tipos de enfermedades infecciosas de las hojas de las plantas de maíz: la roya común producida por el hongo *Puccinia sorghi* y la mancha foliar norteña el hongo *Exserohilum turcicum*.

Puccinia sorghi

Roya Común

Exserohilum turcicum

Mancha Foliar Norteña

CNN y Transfer Learning

- Limitación: Dataset muy pequeño para hacer reconocimiento de imágenes ~ 3000.
- Solución: Transferencia de conocimiento de modelos pre-entrenados

¿Cómo funciona CDD?

Streamlit

Corn Disease Detector (CDD)

Deep Learning API

Welcome to the CDD API. Here you can predict whether the leaf of a maize plant is healthy or if it has the `common rust` or the `northern blight`.

Load an image for recognition.

Conclusiones

- Utilizamos la estrategia de transfer learning para compensar nuestra falta de imágenes.
- Utilizamos un algoritmo de gradiente descendente con tasa de aprendizaje adaptativa.
- Elaboramos una interfaz de usuario mediante *Streamlit* para desplegar el modelo.
